## Products and Services (T3)

The products and services task will be supporting the development of a range of new security and security-related services to support NRENs, institutions and end-users, including:

- SOC Tools A range of tools to help NRENs build efficient Security Operation Centres will be made available across the community.
- Vulnerability Assessment as a Service – A common framework for vulnerability assessment tools will help NRENs ensure that their networks and services are protected against many external threats.
- DDoS Mitigation Distributed
  Denial of Service (DDoS) is a
  major and growing concern for all
  network-based organisations and
  services, as these types of attacks
  can be easy to implement and
  can damage not only the system
  or location under attack but also
  have major knock-on effects across
  the whole network. Tools to help
  mitigate these attacks will therefore
  be developed to support SOCs.
- Firewall on Demand (FoD) –
   Firewalls can protect individual
   services from a wide range of
   attacks but as attacking traffic
   traverses R&E networks it can
   interrupt other services. FoD seeks
   to block attacks, especially DDoS related ones, closer to their source
   so as to reduce their impact on
   R&E networks.
- eduVPN End users also require security and privacy and using third-party networks can expose them to several risks. Opening up institutional services to access from third-party networks can also expose them to attack, eduVPN allows users to connect securely to the Internet and services to better control access to protect themselves from external threats.

Network and service security is an everevolving field and can consume vast amounts of resource within NRENs and Institutions. By instituting the Security Work Package in GN4-3, GÉANT hopes to work with the community to provide a hub of expertise and give NRENs access to the latest security knowledge, skills and tools by the most effective means possible.

For more information about the work of the GN4-3 Security work package see https://wiki.geant.org/display/gn43wp8/GN4-3+Security+Workpackage+WP8

## eduVPN – Providing Extra Security and Privacy for Mobile Researchers and Students

With tens of thousands of hotspots in over 100 countries, eduroam has become an invaluable tool for every mobile student and researcher. However, when eduroam is not available or an additional layer of security and privacy is needed, the question how to protect your privacy when using public WiFi becomes an issue.

Although VPN services can help, they are not without pitfalls. Commercial VPNs may still leave you exposed or generate a digital footprint of your access. Also, if you need to access services inside your institutions network, public VPN access may not be sufficient. This is where eduVPN provides a solution that addresses these issues.

As part of the new Security Work Package in the GÉANT project, eduVPN has been adopted by a number of R&E institutions as their enterprise VPN solution and an increasing number are considering eduVPN as the solution for giving their users secure access to protected resources on their internal networks.

Using a fully open source solution that has been developed by the NREN community and been subject to a robust auditing process (both the server and clients have been audited multiple times) is usually attractive to institutions. In addition to providing strong encryptions, eduVPN offers a number of compelling features. It provides full IPv6 support, both inside and outside the tunnel (providing IPv6 addresses to clients and connecting to the server over IPv6). It also integrates with existing identity managements systems using SAML, LDAP or Radius. Another major benefit eduVPN offers NRENs and institutions is the support for generic hardware to operate the VPN gateway. New features do not require a new VPN box, instead the open-source software can simply be upgraded. Where additional VPN capacity is needed, it is easy to add additional CPU cores or bandwidth.

For end-users, there are other benefits, in particular the user-friendliness of the apps. Inspired by the idea that VPN configuration should be simple on any device, once authenticated through their federated identity, eduVPN users can configure their device, activate or deactivate a VPN in just a few clicks. eduVPN apps for Windows, macOS and Android have been available for some time and, following the successful resolution of some licensing issues, an iOS app became available in March 2019. Native applications are available for all major platforms.

In addition to connecting to protected resources at institutions eduVPN also increases security when surfing the web. On selecting a national instance in the apps, which is typically operated by an NREN, the user can route their traffic to the Internet via a VPN to a trusted gateway. The number of national instances used to connect to the Internet is growing, and this is particularly useful when connecting on an unsecure network - for example a public WiFi network where eduroam is not available. As an added benefit the client can use IPv6 and if the network is restricted in some sense, circumvent that.

Last but not least, on these national instances, all current operators have chosen to allow "guest usage". This permits the user to route their traffic via eduVPN to a gateway to the Internet operated by their own NREN or by a participating NREN in another country. Using this eduroam-inspired approach, eduVPN enables easy, secure and free access to Research and Education networks.
